# Automate Workout Sign-up Registration for *n* people by Matthew Hannon

There became a limited and hard to collate time period to have 3-4 people all obtain registration slots at the local swimming pool at the same time. It felt unfair to me that the people I wanted to exercise with could potentially not have a lane due to others signing up earlier. It is a sad moment when 3 people want to swim, but only 2 lanes were obtained in time. In order to alleviate this psychologic hamper (we could have shared the same lane… But this solution offered better results). This code registers *n* number of people a few seconds within the initial sign-up time. The site used by the vendors is a popular organization website, and the same methods employed here could be utilized for other sign-up groups.

The software would sign-up n number of users within ~1-4 seconds of the site accepting registration applications. It would automate the page with predefined text representing the person that wanted to work out. After a few seconds (can be minimized, but best to stay out of the sun's rays). Automatically the user would receive an email with a known date/time slot to their email.

Great way to obtain multiple people all exercising at once at the same place without having to worry about lack of registration slots.
